Mini Project: Game Menu System using Python

1. Project Title

Game Menu System using Python

2. Problem Statement

To design and implement a simple game menu system that allows the user to select options such as starting the game, viewing the score, or exiting the program using a menu-driven approach.

3. Objective

- To create a menu-driven program
 - To understand loops and conditional statements
 - To simulate a simple game interface
 - To handle user input effectively
-

4. Tools Used

- Python 3
 - VS Code / IDLE
-

5. Description

This project simulates a simple game menu. The program displays a menu with options such as starting the game, viewing the score, or exiting. The menu continues to appear until the user chooses to quit. It demonstrates the use of loops and conditional statements in Python.

6. Algorithm

1. Initialize the choice variable
 2. Display the game menu
 3. Read the user's choice
 4. If choice is "1" → start the game
 5. If choice is "2" → show the score
 6. If choice is "quit" → exit the program
 7. Otherwise → show invalid choice message
 8. Repeat until the user quits
-

7. Program (Python Code)

```
choice = ""
```

```
while choice != "quit":
```

```
    print("\n--- Game Menu ---")
```

```
    print("1. Start Game")
```

```
    print("2. View Score")
```

```
    print("Type 'quit' to exit")
```

```
    choice = input("Your choice: ")
```

```
    if choice == "1":
```

```
        print("Starting game...")
```

```
    elif choice == "2":
```

```
        print("Your score: 100")
```

```
    elif choice == "quit":
```

```
        print("Thanks for playing!")
```

```
    else:
```

```
        print("Invalid choice")
```

8. Sample Output

--- Game Menu ---

1. Start Game

2. View Score

Type 'quit' to exit

Your choice: 1

Starting game...

--- Game Menu ---

1. Start Game

2. View Score

Type 'quit' to exit

Your choice: 2

Your score: 100

--- Game Menu ---

1. Start Game

2. View Score

Type 'quit' to exit

Your choice: quit

Thanks for playing!

9. Result

The game menu system successfully displays options, processes user input, and exits when the user chooses to quit.

10. Conclusion

This project demonstrates how Python can be used to create a simple menu-driven application using loops and conditional statements. It helps in understanding user interaction and basic program control flow.
